NotesApp QA 2026-11-02

Every page, panel and sheet at iPhone size (390 × 844 pt), dark and light, then the PC (1366 × 860).
Captured 11/2/2026, 4:15:29 PM · 88 screens

Notes on the iPhone — 30

Files that are not notes — 8

Tasks — 8

Calendar, daily notes, habits, flashcards — 8

Other pages — 14

Light theme (iPhone) — 4

The PC (1366 × 860) — 16

NotesApp: QA pass, 2 Nov 2026

`origin/main` at `ff3263a` plus `fix/e2e-qa`, on a scratch vault seeded with `npm run seed` (notes with links, tags, properties and table formulas; a spreadsheet, a drawing, a canvas, a PDF and an image; task lists with sections, subtasks, reminders and repeats; a Kanban board; daily notes, templates, flashcards, habits, bookmarks, history, trash; a second vault). Driven at iPhone size (390 × 844, touch, no hover, an iPhone user agent) and as the PC (1366 × 860), dark and light, against Vite (`npm run reset`) and against the jar serving the built frontend as the Docker image does (`npm run reset -- --prod`). Browser: Edge 156 (Chromium), since this PC has no Chrome; CI uses Chrome.

Covered: every page, panel and sheet (the screen inventory after these pages), the API's edge cases (paths, names, sizes, versions, CSRF, Host and identity allowlists, Funnel, vault isolation, the event stream), two devices on one note including offline edits, and the everyday flows (new note, links, rename, delete and undo, capture, daily notes, quick add, search).

Verdict

Nothing blocks a deploy. No High findings: the version protocol, conflicts, trash, history, moves and the security boundary held under everything the suite threw at them, and no text typed into a note was lost. Two Medium bugs, both only in the built app and both about timing (F1, F2), are tests marked `KNOWN BUG`. Four Low ones were trivial and are fixed on this branch with regression tests (F3–F6).

Severity	Count	
High	0	
Medium	2	F1, F2 (open)
Low	15	F3–F6 fixed; F7–F17 open

Fixed on this branch

#	Sev.	What was wrong	Fix	Regression test
F3	Low	PC, split panes: in a pane about 370 px wide the save status and buttons slid over the breadcrumb ("Projects / Home r✓Saved").	Header columns keep the buttons' width; the breadcrumb ellipsizes.	`e2e/tests/ui/layout.spec.ts`
F4	Low	Phone: a Dataview `TABLE` split words ("ratin|g", "readi|ng"): rendered tables inherited CodeMirror's break-anywhere wrapping.	Rendered table cells in the editor wrap at words; the table scrolls sideways.	`e2e/tests/ui/layout.spec.ts`
F5	Low	Phone, Compare versions: the legend wrapped between the red swatch and its label.	Swatch and label are one unbreakable key.	`e2e/tests/ui/sync.spec.ts`
F6	Low	Compatibility report: `![[Budget.sheet#Budget!A1:C6]]` listed as a missing heading; a task link `[[Inbox.tasks#^id]]` would be a missing block.	Headings and block ids are checked only when the target is a note (DESIGN §5.23).	`CompatScannerTest.subpathsIntoDocumentsAreNotHeadings`

Open: Medium

F1. Offline, the built app reloads itself into the browser's "no internet" page. Open a note, lose the network, click into the note: the editor asks for a lazy chunk (`htmlToMarkdown`) that cannot load offline; `vite:preloadError` is taken for a new deploy and `handleNewBuild()` reloads the page (nothing is unsaved yet). Offline, the reload lands on the browser's error page. Only without a

service worker (the worker precaches every chunk): a first visit, a browser or webview that blocks workers, every Playwright run. Suggested fix in `state/buildCheck.ts`: reload only when the server's build really changed (skip when `navigator.onLine === false`, or confirm through `/api/status`'s `X-Notes-Build`). Test: `known-bugs.spec.ts` (production mode).

F2. New note pressed while the app is still opening loses what is typed. On a slow start (the tree answering after 1.5 s; a phone's cold start over the tailnet) New note creates `Untitled.md` but its title does not get the focus, so the typing goes nowhere; with other timings the start page's note replaces the new note once loaded. An empty `Untitled N.md` is left behind. Every time on the PC with a delayed tree, sometimes on the phone. Suggested fix: the home route must not redirect once the user has navigated, and the pending note's title takes the focus whenever it mounts. Test: `known-bugs.spec.ts` (PC).

Open: Low

#	Where	Finding	Suggestion
F7	Compatibility report	The app's own inline formulas (`` `=costs!D5/12` ``) are reported as unsupported "Dataview queries".	Report only `` `$=…` `` and `=` with a dotted field (`this.file.name`); a decision, since only the engine knows.
F8	Ask your vault	Off, it says questions go to "Anthropic's Claude API"; under the box, "Sent to Claude with your subscription" and "$0 of $5.00 this month" (an API budget).	One wording per provider; no budget for the subscription.
F9	Search, Backlinks	A task's related note shows as `[Home renovation](/Projects/Home%20renovation.md)`.	Render it as a link, or index it as `[[Home renovation]]`.
F10	History panel	Batch subjects list hidden files first: "Update 28 files: .notesapp/bookmarks.json, …".	Visible files first.
F11	Notes, phone	A Dataview block's ↻ and `</>` sit over the table's last header on touch.	A bar above the output on touch.
F12	Habits	The year grid's first month label is cut ("n", "ul").	Hide a partly scrolled-out label.
F13	PDF, phone	The zoom select reads "Automati".	"Fit" or an icon at phone width.
F14	Excalidraw, PC pane	The toolbar is clipped in a 370 px pane (sized by the window).	The compact layout by pane width.
F15	Formulas	`` `=costs!D5/12` `` shows 441.6666667 though column D is currency; Sheets shows $441.67.	Inherit a single referenced cell's or column's format.
F16	New note	Leaving a new note at once leaves an empty `Untitled.md` (as Obsidian).	Delete an untouched empty Untitled note when left.
F17	Editor	"Tab indents in the editor…" shows after Enter from a new note's title.	Show it on the first Tab.

Checked and fine

- Version protocol: stale saves get the server copy; equal content never conflicts; retried saves and creates (`Idempotency-Key`) succeed once; deleted and moved files say so (`movedTo`).
- Names and paths: `..` (also encoded), `\`, `//`, dot folders, Windows names, over-long names, `:` `?` `#` `[[` refused; NFD in, NFC out; `+` survives the query string.
- Moves rewrite wikilinks, Markdown links, embeds, task titles and task links (never in code); sheets and drawings are reported; bookmarks and history follow.
- Trash, history and restore as documented; search with phrases, `tag:`, `path:`, negation, properties, typos, prefix, PDF pages, sheet cells and tasks; long and catastrophic queries refused in time.

- Security: `X-Client-Id`, `Origin`, `Sec-Fetch-Site`, Host (421), identity (403, RFC 2047 names, commit authors), Funnel (403 everywhere), security headers, `no-store`.
- Vaults: per-vault files, search, tasks and trash; no path from an extra vault reaches the default one.
- Live sync: events in order, no echo, replay and resync; two browsers: live updates, the conflict banner after offline edits, Compare, Keep mine, Take theirs.
- Everyday flows on both devices; no console errors.

Not covered

A real iPhone (Safari's keyboard, safe areas, gestures, the installed app and its service worker); Tailscale itself, deploys, the mirror, backups, ntfy and Web Push; Ask, transcription, publishing, the desktop app and the clipper; editing inside drawings and canvases; large vaults.

After the concurrent merges

- Saved searches into bookmarks: the suite tests `type: "search"` bookmarks, never `/api/searches`; the Search page's ☆ goes; re-run `npm run screens`.
- Sheets parity pass: tests use the formula bar's "Cell reference" and "Contents of B4" and Enter to commit.
- User guide: nothing asserts Welcome's content; the inventory shoots Welcome and `Live Preview demo.md` when they exist.
- Hotkeys (quick add off Mod-Alt-T): the suite uses buttons, no hotkeys.
- When F1 or F2 is fixed, delete its `test.fail` line.

UX pass, 2 Nov 2026

A pass over every screen at iPhone size and on the PC, with four rules: one obvious primary action per screen; rare actions behind ⋯; the same words everywhere; and the user's two devices first (the iPhone Home-Screen app, the Windows PC). Nothing below was changed on this branch except F3–F5; each item is a proposal with a size (S, M, L).

Whole app

	Now	Proposal
Phone top bar	Title · status · **+** (Quick capture) · search · tabs · ⋯	The **+** of a notes app reads as New note; New note is two taps away in the drawer. Long-press + for Capture, or a small menu (New note / Capture) on +. (S, a product decision)
Phone title	Cut after about ten characters ("Home reno…") by four icons	Drop the tabs counter when there is one tab. (S)
Narrow PC panes	Breadcrumb overlap (fixed, F3); property names cut to "stat…", "bud…"; tag rows leave tall gaps	A minimum width for the name column, names wrapping instead. (S)
Start of the app	New note during the first second goes wrong (F2)	Disable New note until the workspace is ready, or fix the race. (M)

Notes

- **Goal:** read and write. **Primary:** typing. **Secondary:** properties, links, the ⋯ menu.

- **Properties on the phone** take two rows each (name, then value): seven fill the first screen before the note starts. Proposal: one row each from 360 px (name 35 %, value 65 %), and collapse the block on the phone when it has more than four. (M)
- **Table formats** (`%% formats: B=currency %%`) show as a "%%" chip under every formatted table. Proposal: hide comment lines that only hold a table's formats and id; show them on a click in the table's grip menu. (S)
- **Inline results** do not inherit the format they read (F15). (M)
- **Dataview tables** on the phone: fixed (F4); the ↻ `</>` bar covers the last header (F11). (S)

Search

- **Goal:** find a note. **Primary:** the box. **Secondary:** sort, bookmark the search.
- Results do not say what they are: a spreadsheet, a drawing or a task list shows the note icon (only a PDF has a badge). Proposal: the explorer's kind badge (SHEET, EXCALIDRAW, TASKS) on results. (S)
- Task snippets show the indexer's Markdown (F9). (S)
- ☆ and the bookmark button sit side by side while saved searches fold into bookmarks: one "Bookmark this search" after the merge. (S, in progress elsewhere)

Files that are not notes

- **Canvas** opens zoomed to fit the board: on the phone, card text is about 7 px. Proposal: open at 100 % on the first card, or remember the view per device. (M)
- **Excalidraw** opens where it was left (the hall is off-screen on a phone) and its toolbar is clipped in a narrow PC pane (F14). Proposal: zoom to fit on the first open of a device. (S)
- **PDF**: the zoom select is cut on the phone (F13). (S)

Tasks

- **Goal:** see what is due and tick it off. **Primary:** the check circle; **Add task**.
- On the PC the **Lists** page has no Add task (the phone has the floating +; Today has a button). Proposal: Add task in every task page's header on the PC. (S)
- A task due on a Wednesday that repeats "every week on Monday" is accepted as it is. Proposal: say so in the detail sheet, or move the date to the rule's next day, as Todoist does. (S)

Calendar, habits, flashcards

- Calendar: clear on both devices; the day details and "Create daily note" work as described.
- Habits: the year grid's first month label is cut (F12). (S)
- Flashcards: one primary button (Study now / Show answer), big answer buttons with intervals: no change.

Other pages

- **Graph** on the phone shows dots without labels until zoomed. Proposal: labels for the largest nodes at the default zoom. (S)
- **Ask your vault** (off): two descriptions of where the text goes (F8). (S)
- **Compatibility report**: false findings fixed (F6) or listed (F7).

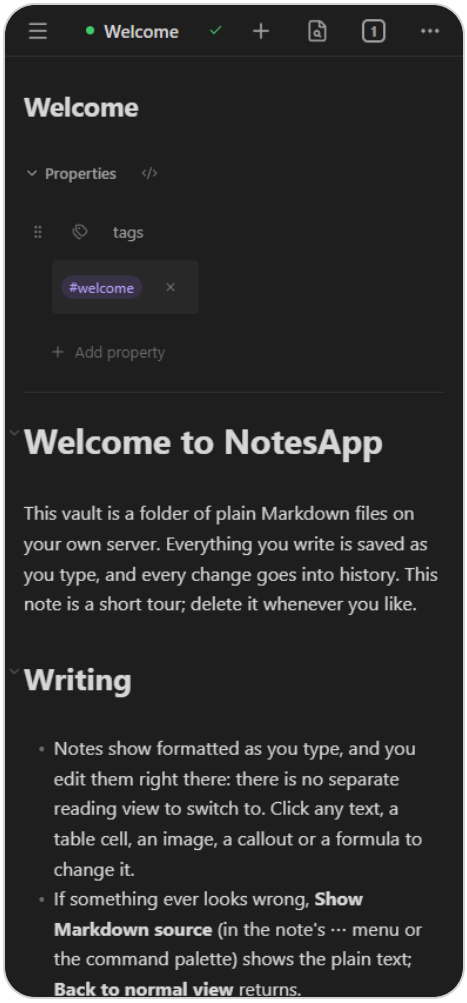

New notes

- New note makes `Untitled.md` at once; leaving it empty keeps it (F16, as Obsidian). Proposal: delete an untouched empty Untitled note when it is left. (S)

Checked and fine

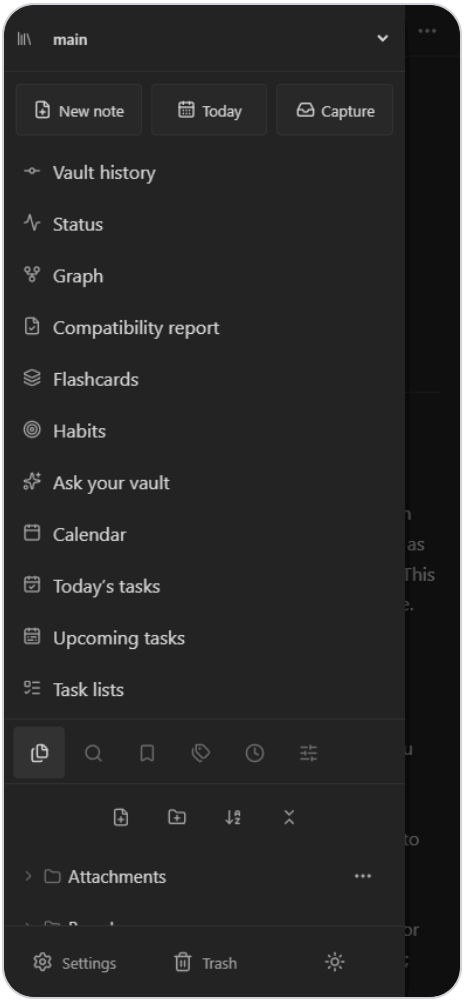

The conflict banner and Compare (one primary, Keep mine), the quick switcher (aliases first, Create and Search rows), quick capture, quick add with chips, the trash, the vault switcher and Settings › Vaults, the light theme on the main pages, the status page.

Notes on the iPhone

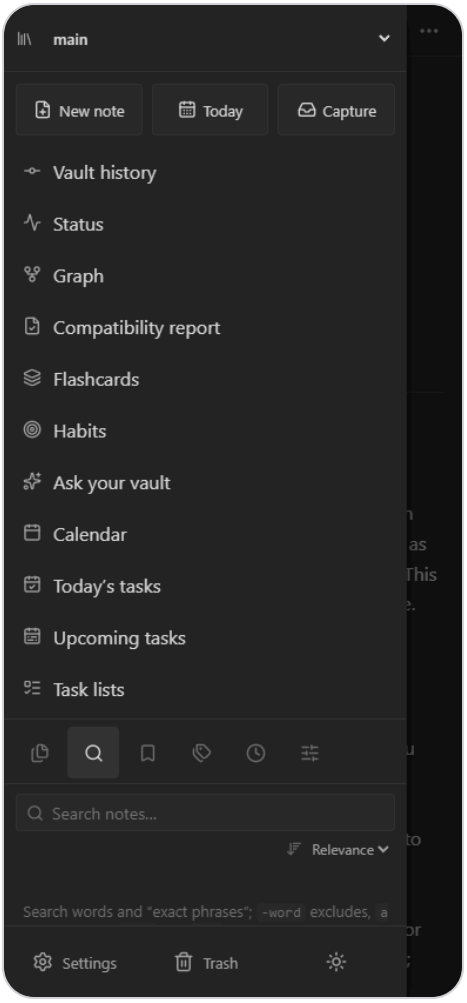

Welcome note

What a new vault starts with.

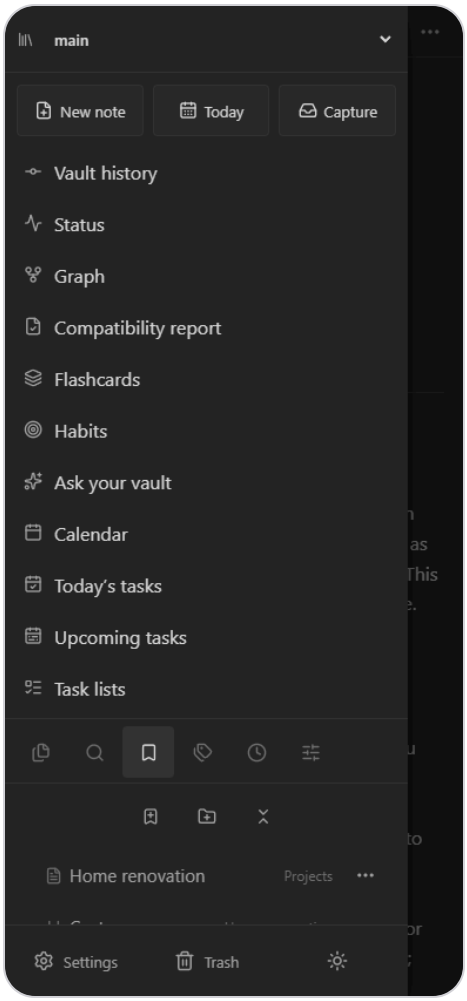

Drawer: files

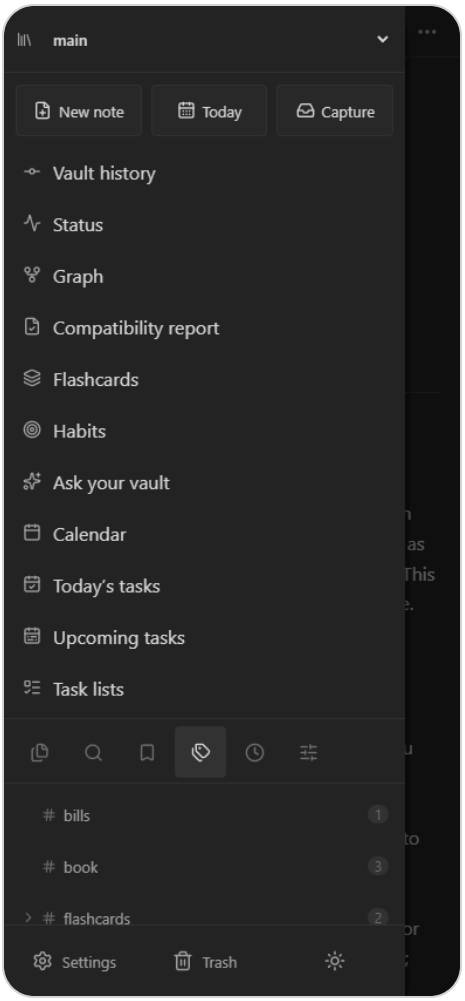

Vault switcher, New note / Today / Capture, the pages, the side tabs and the file tree.

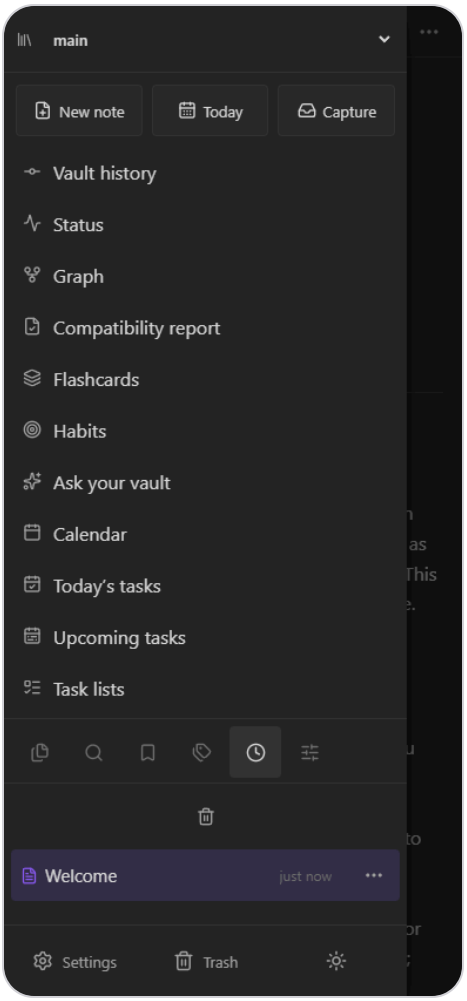

Drawer: search

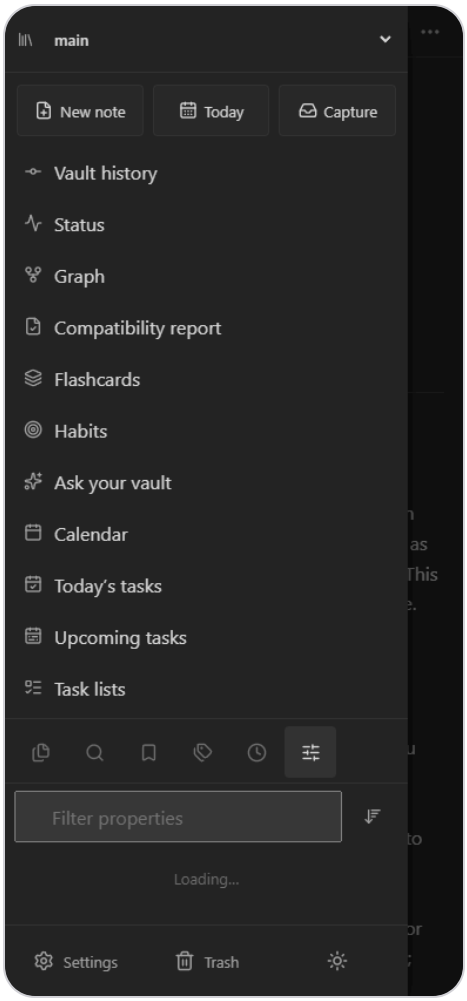

Drawer: bookmarks

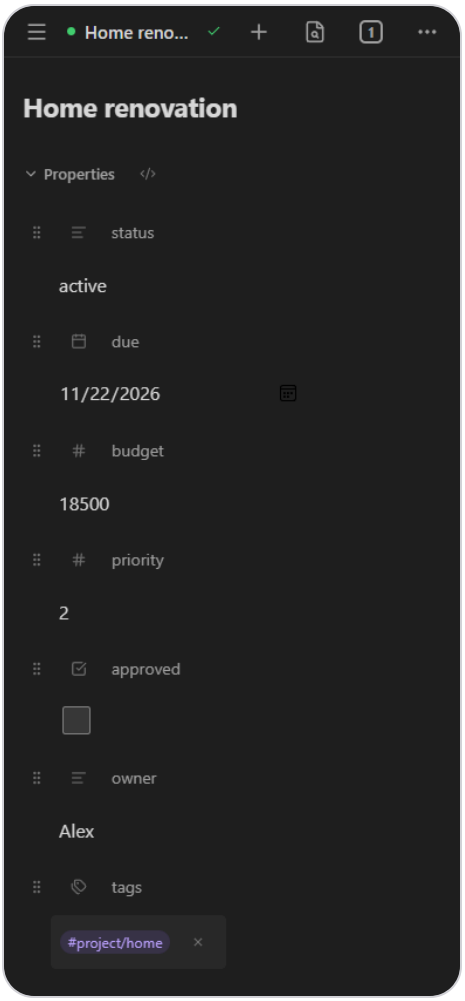

Drawer: tags

Drawer: recent files

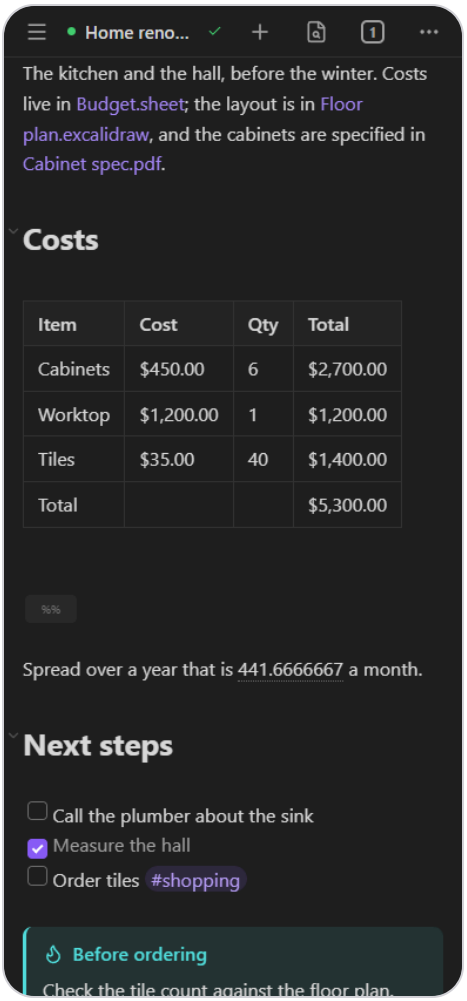

Drawer: properties

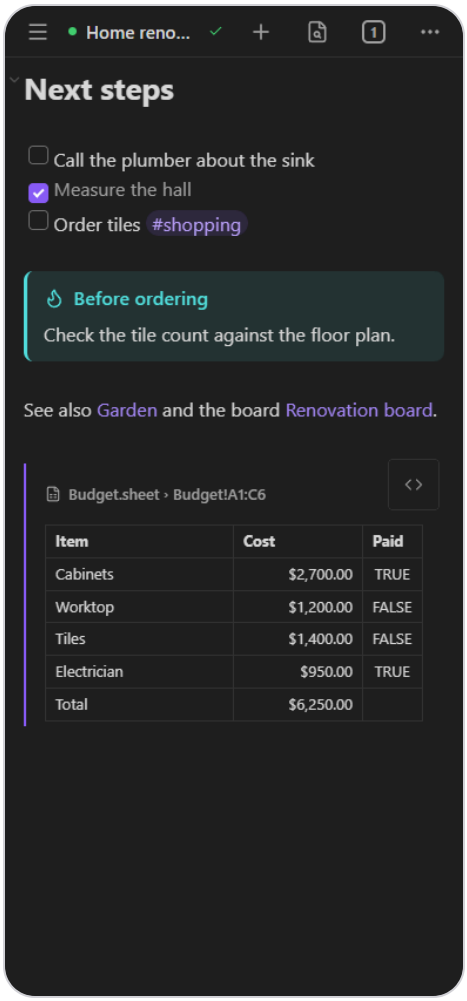

Note: properties

Typed properties (text, date, number, checkbox, tags, aliases) edited in place.

Note: a table with formulas

`=B2*C2` and `=SUM(D2:D4)` computed in the grid; formats from the %% formats %% line.

Note: tasks, callout, links and a sheet embed

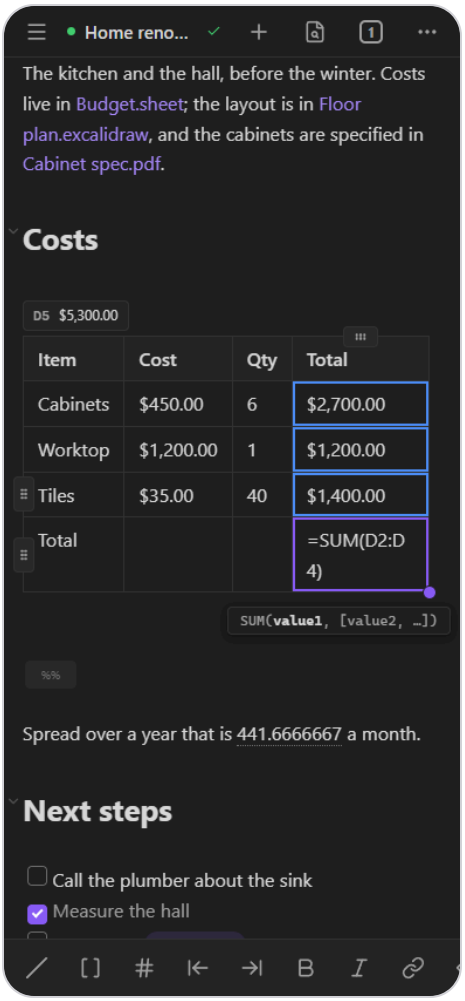

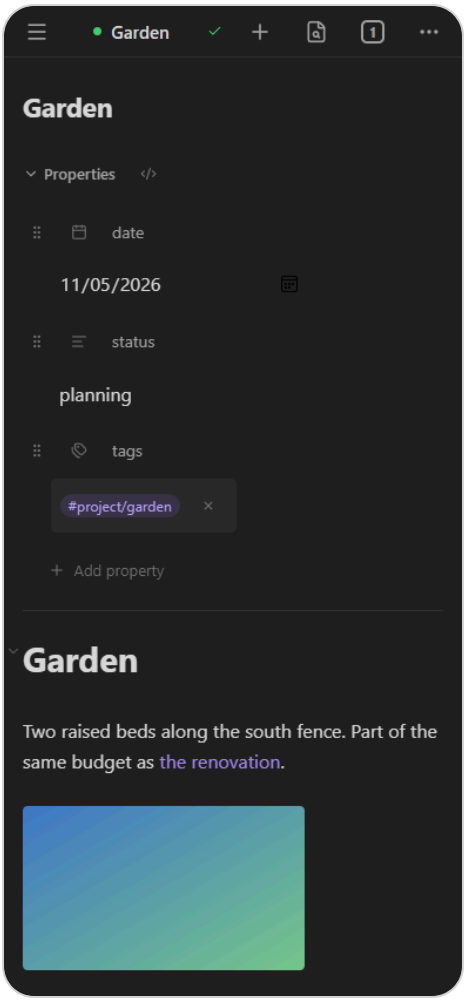

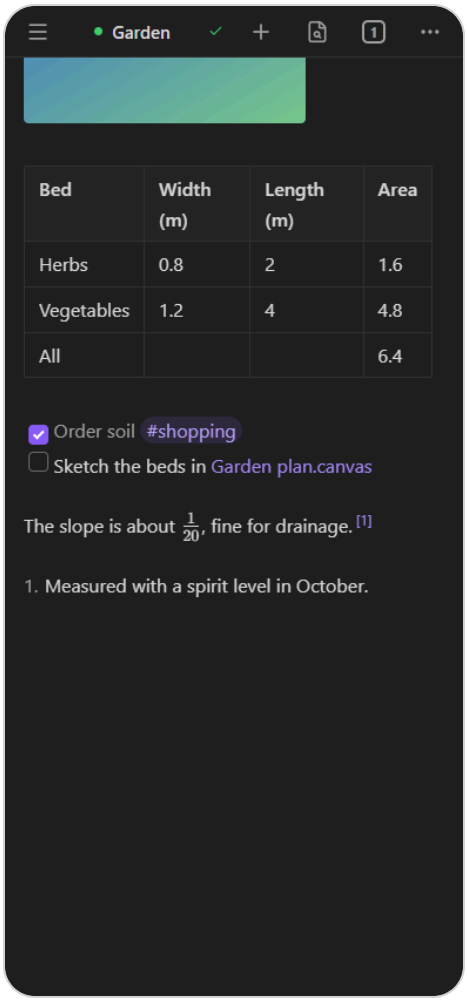

Table: editing a formula

The formula bar names the cell and shows its result; the signature hint under the cell.

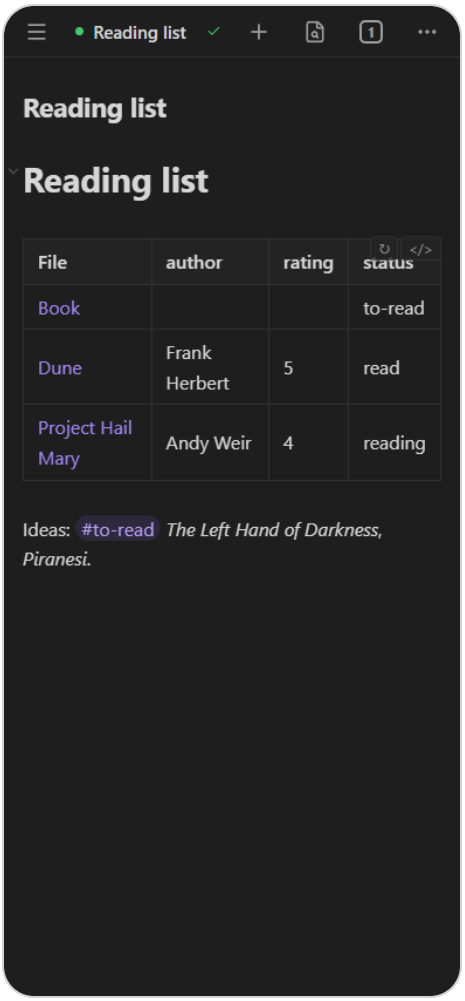

Note: image embed and table

An attachment embedded at 240 px, then a second table.

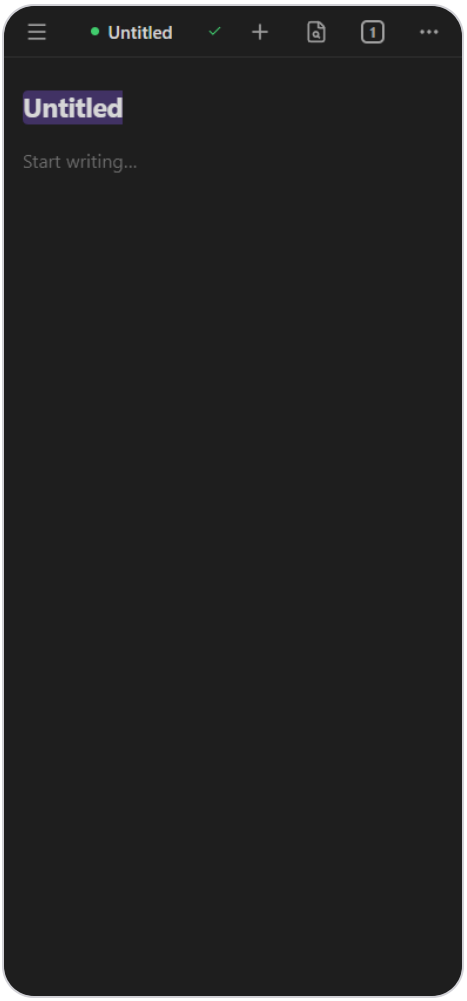

Note: math and a footnote

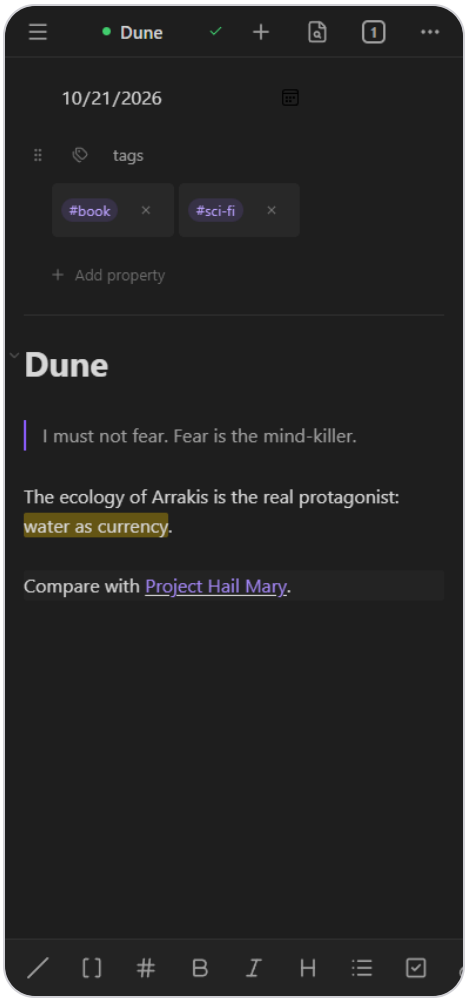

Note: a Dataview table

Runs in the sandbox; the file keeps the query.

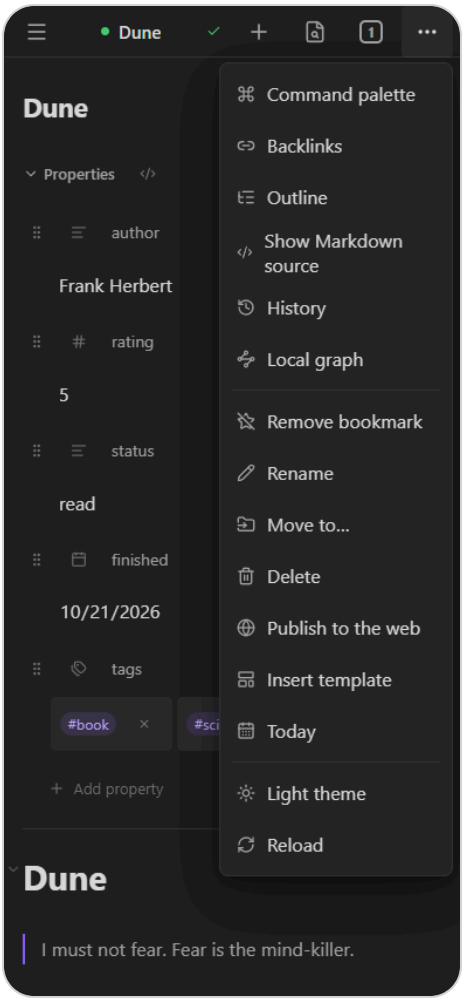

New note

Untitled.md is made at once, its title selected for typing.

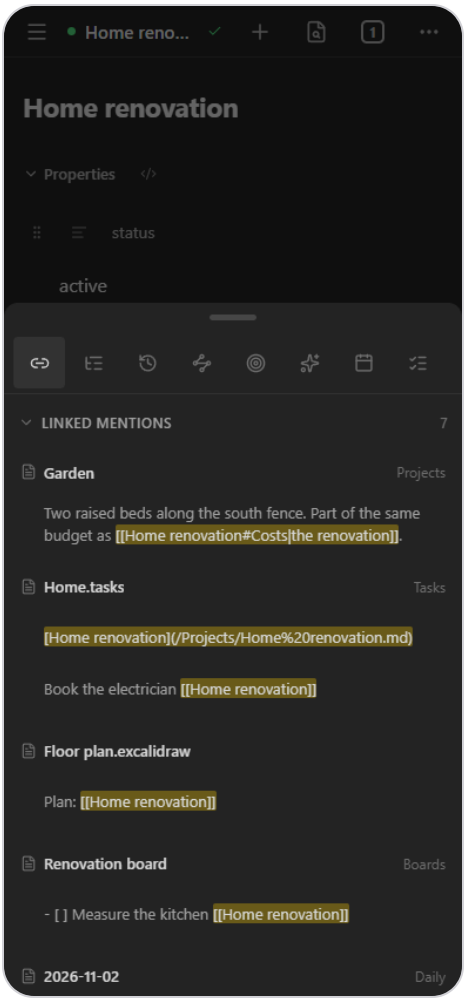

Editing: the keyboard toolbar

Formatting buttons above the iPhone keyboard (the keyboard itself is not drawn by Chrome).

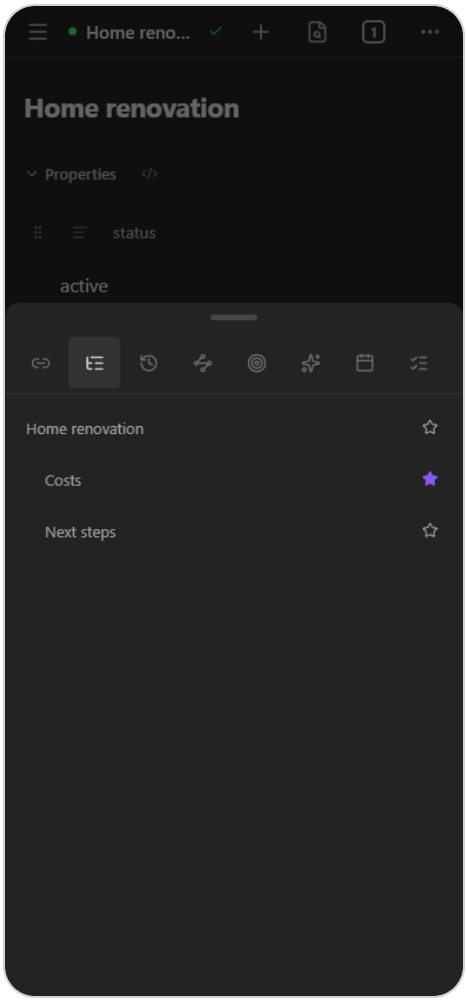

Note ⋯ menu

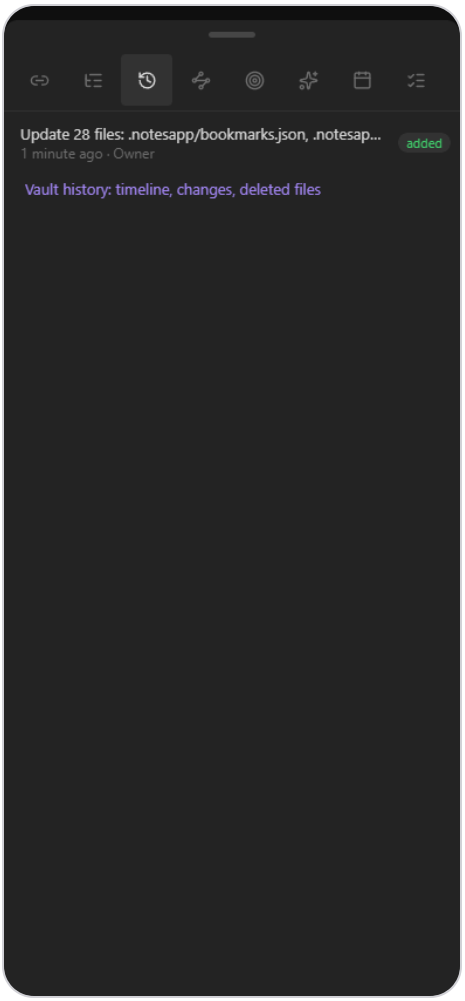

Panel: Backlinks

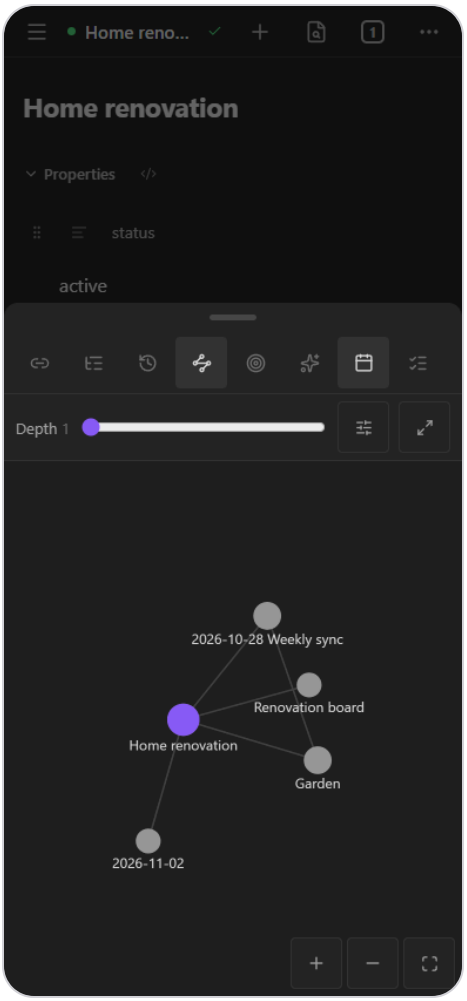

Side panels open as a bottom sheet on the phone.

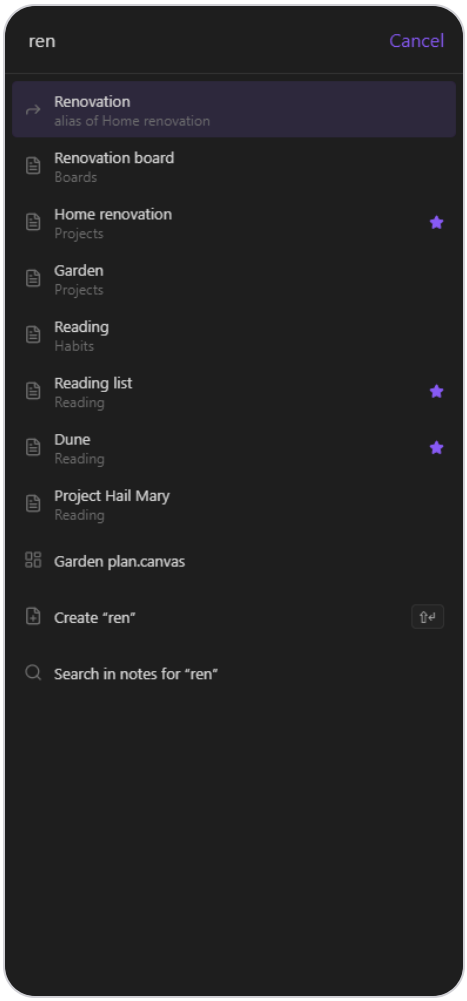

Panel: Outline
Side panels open as a bottom sheet on the phone.

Panel: History
Side panels open as a bottom sheet on the phone.

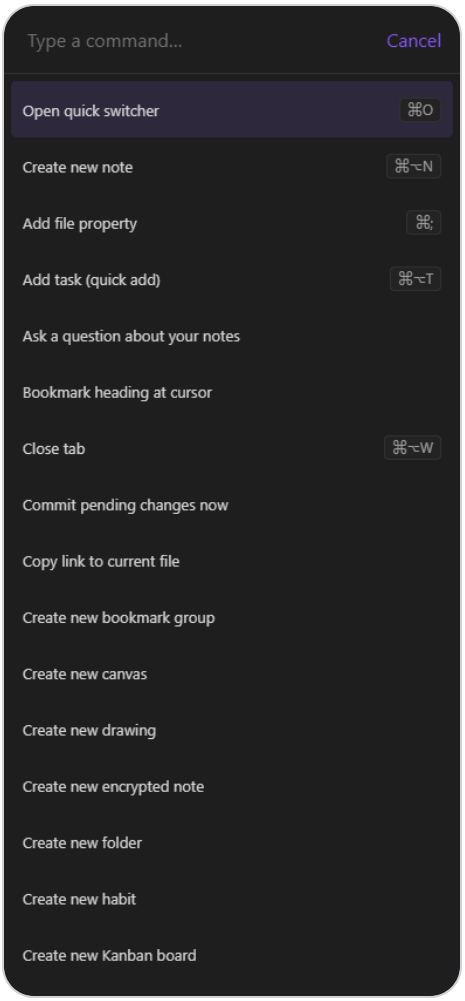

Panel: Local graph
Side panels open as a bottom sheet on the phone.

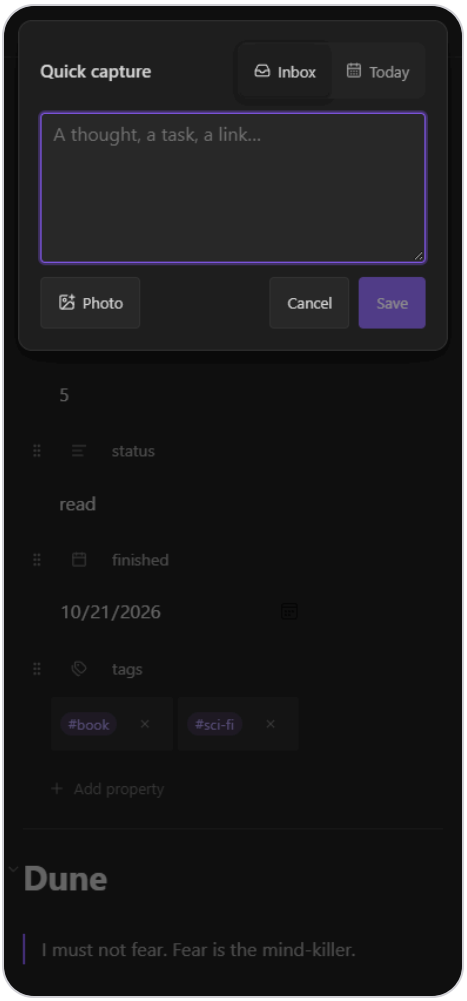

Quick switcher

Fuzzy over names and aliases ("Renovation").

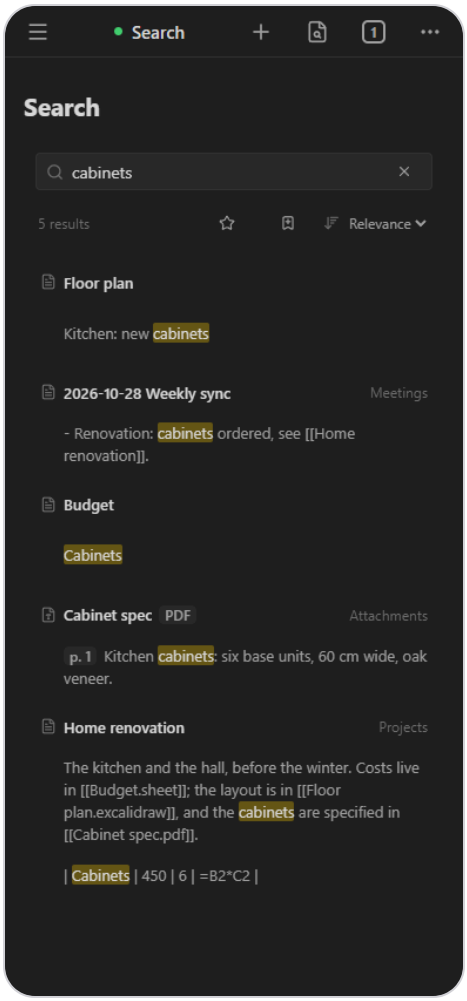

Command palette

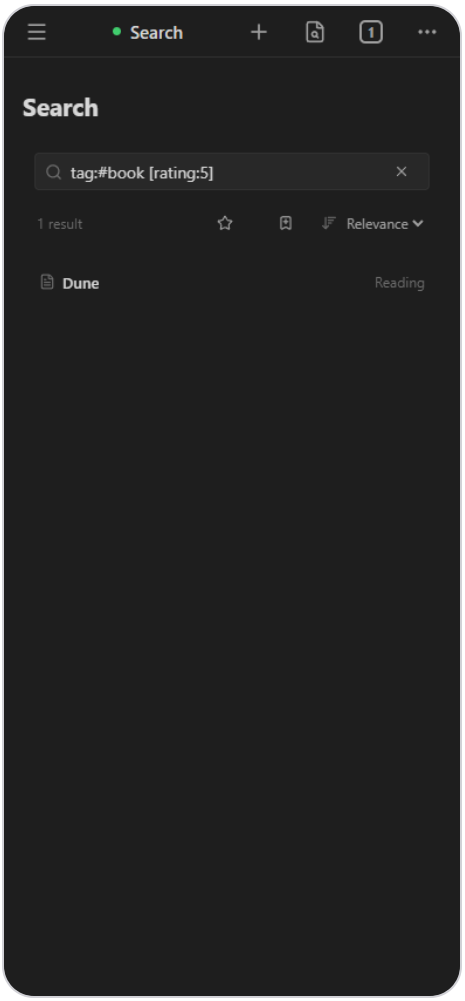

Quick capture

The + in the top bar: a thought to the Inbox or today’s note.

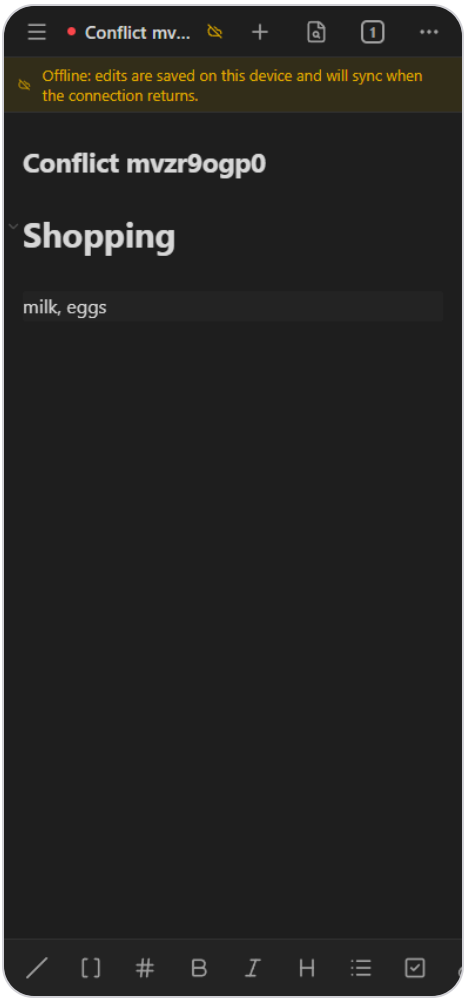

Search

Notes, the PDF's text (with its page) and spreadsheet cells in one list.

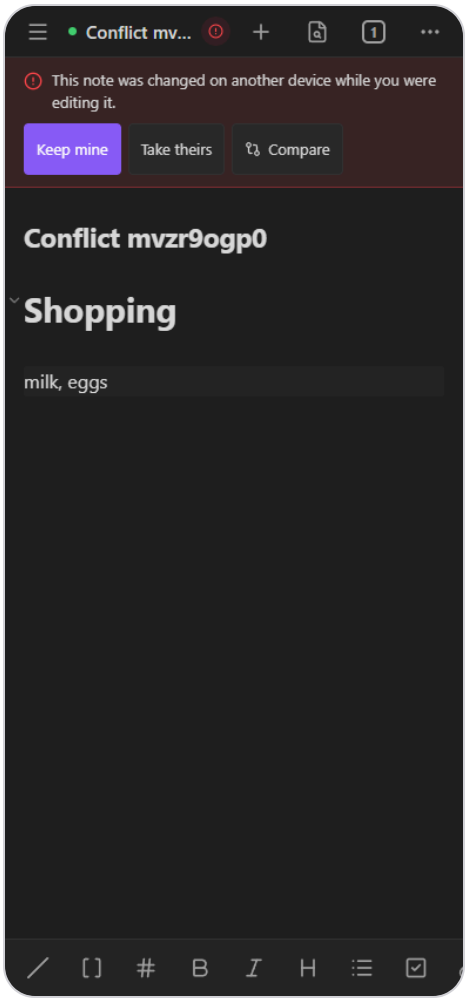

Search with filters

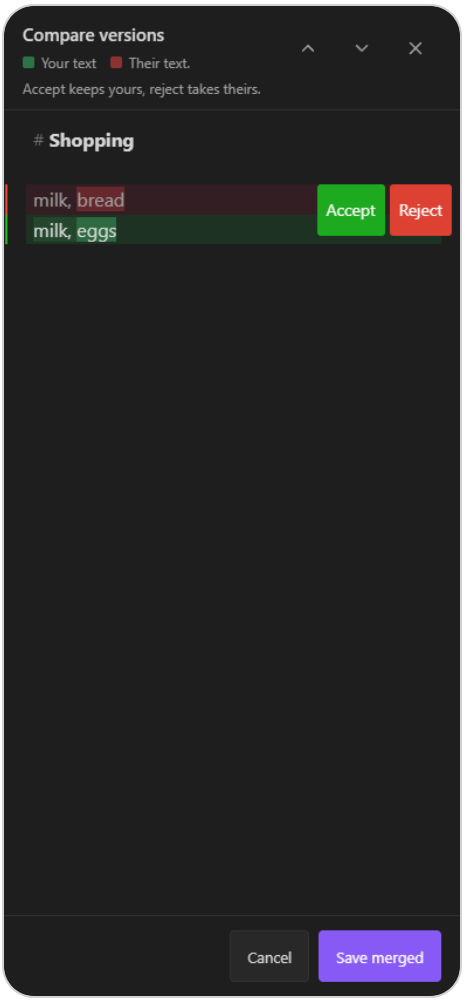

Offline while editing

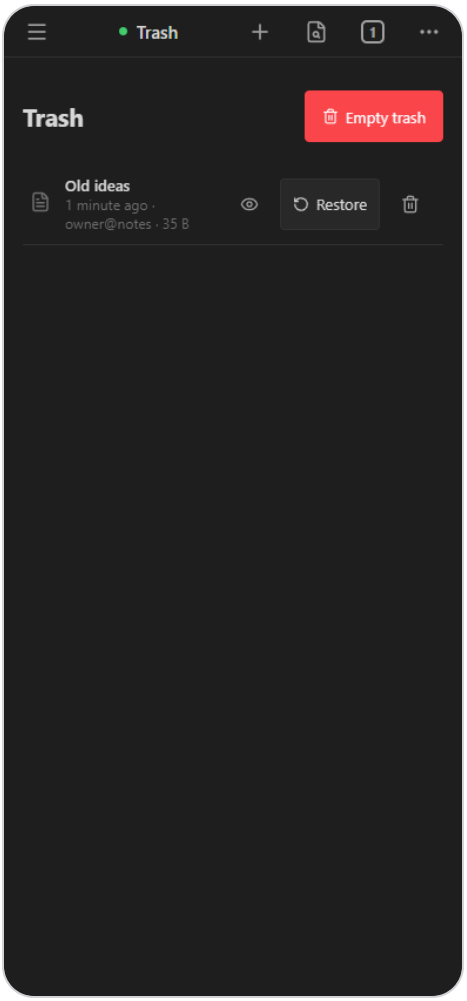

Edits are kept on the device and saved when the connection is back.

Conflict banner
Keep mine, Take theirs, or Compare side by side.

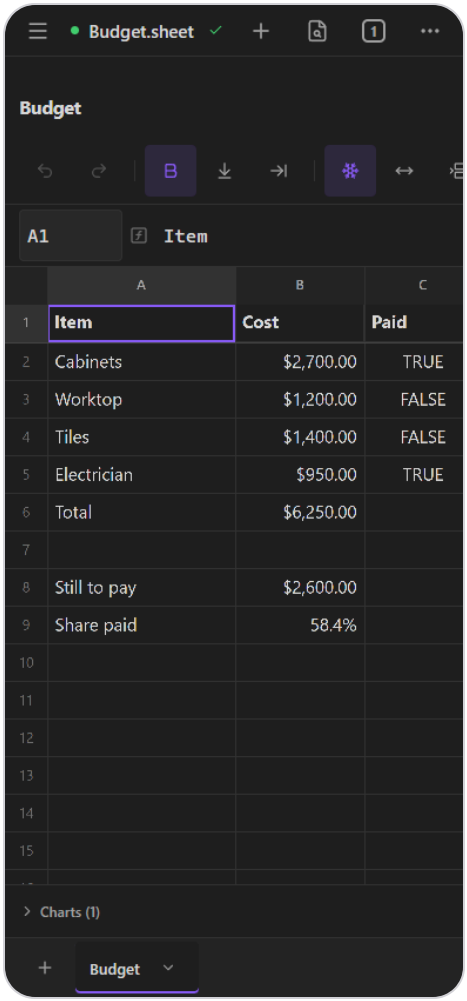

Conflict: compare

Trash
Restore or delete for good.
